

1) github 'da bir repo oluşturu.

github → repositories → new → serir-fusion

1 Create a new repository on GitHub. To avoid errors, do not initialize the new repository with `README`, license, or `gitignore` files. You can add these files after your project has been pushed to GitHub.

2 Open Git Bash.

3 Change the current working directory to your local project.

4 Initialize the local directory as a Git repository.

```
$ git init
```

5 Add the files in your new local repository. This stages them for the first commit.

```
$ git add .  
# Adds the files in the local repository and stages them for commit. To  
unstage a file, use 'git reset HEAD YOUR-FILE'.
```

6 Commit the files that you've staged in your local repository.

```
$ git commit -m "First commit"  
# Commits the tracked changes and prepares them to be pushed to a remote  
repository. To remove this commit and modify the file, use 'git reset --soft  
HEAD~1' and commit and add the file again.
```

7.1 At the top of your GitHub repository's Quick Setup page, click  to copy the remote repository URL.

7.2 \$ git branch -M main

8 In the Command prompt, add the URL for the remote repository where your local repository will be pushed.

```
$ git remote add origin remote repository URL  
# Sets the new remote  
$ git remote -v  
# Verifies the new remote URL
```

9 Push the changes in your local repository to GitHub.

```
$ git push origin master  
# Pushes the changes in your local repository up to the remote repository you  
specified as the origin
```

main olmalı !!
